**Subject: Bannister Federal Complex – CenterPoint Due Diligence Investigation
Stage III and IV Data Report (non-Radiological Parameters)**

Dear Jim:

With this letter I am transmitting to CenterPoint the Stage III and IV Data Report (non-Radiological Parameters) for the Bannister Federal Complex Due Diligence Investigation. This report and its appendices contain all of the soil chemistry analytical results for Stages III and IV, which were completed during September and October, 2015.

The report is primarily designed to transmit the information, with minimal data interpretation. Nonetheless, the figures and tables highlight those compounds that exceed current USEPA risk-based screening levels, as well as the existing RCRA Part I Permit standards for the BFC.

The appendices include all final laboratory reports from Eurofins Lancaster Laboratory, the data validation report from EcoChem, Inc., a table of all sample results, and an MS Access database with the validated results.

If you have any questions, please free to phone or email.

Sincerely,

S. S. PAPADOPULOS & ASSOCIATES, INC.

Harvey Cohen, PhD, RG
Principal

List of Acronyms

1,2-DCE	1,2-Dichloroethylene (or 1,2-Dichloroethene)
BFC	Bannister Federal Complex
BTEX	Benzene, Toluene, Ethylbenzene, and Xylenes
CMS	Corrective Measures Study
COC	Contaminant of Concern
DOE	Department of Energy
EC	Evans Consulting, PA
GSA	General Services Administration
KCP	Kansas City Plant
MDNR	Missouri Department of Natural Resources
ND	Non-Detect
NFA	No Further Action
NNSA	National Nuclear Security Administration
PAH	Polycyclic Aromatic Hydrocarbons
PCB	Polychlorinated Biphenyls
RCRA	Resource Conservation and Recovery Act
RBSL	Risk-Based Screening Level
SSP&A	S.S. Papadopoulos & Associates
SVOC	Semi-Volatile Organic Compound
SVMP	Soil Vapor Monitoring Point
SWMU	Solid Waste Management Unit
TCE	Trichloroethylene (or Trichloroethene)
TPH	Total Petroleum Hydrocarbons
VC	Vinyl chloride
VOC	Volatile Organic Compound

REPORT

Section 1

Introduction

Under the authority of the National Defense Authorization Act of 2014, and an agreement between the National Nuclear Security Agency and CenterPoint Properties Trust (Contract No. DE-NA0002662), CenterPoint is currently evaluating the potential for transferring portions of the Bannister Federal Complex (BFC), located at 1500 East Bannister Road in Kansas City, Missouri, to a new property owner. Portions of the BFC being considered for transfer are generally those west of the existing Union Pacific railroad tracks (Figure 1). As part of this evaluation, CenterPoint is completing a due diligence investigation of the property, to include records review, analysis of existing data, and targeted site investigations. CenterPoint has retained S.S. Papadopoulos & Associates (SSP&A) and Evans Consulting (EC) to assist in this investigation.

The due diligence investigation is proceeding in a number of stages. This document is concerned only with soil samples collected during Stage III and Stage IV that were submitted for chemical analysis. Data obtained from radiological surveys of soil, groundwater, and building materials will be addressed in separate reports.

These samples were collected as per work plans approved by the Missouri Department of Natural Resources (MDNR):

- S.S. Papadopoulos & Associates and Evans Consulting, 2015. Bannister Federal Complex, Due Diligence Site Investigation, Work Plan, Stage I - Soils, February;
- S.S. Papadopoulos & Associates and Evans Consulting, 2015. Bannister Federal Complex, Due Diligence Site Investigation, Work Plan, Stage II - Soils, April 21 (with revised map of May 15, 2015);
- S.S. Papadopoulos & Associates and Evans Consulting, 2015. Bannister Federal Complex, Due Diligence Site Investigation, Work Plan, Stage III – Radiological Sampling, Revised October 9.
- S.S. Papadopoulos & Associates and Evans Consulting, 2015. Bannister Federal Complex, Due Diligence Site Investigation, Work Plan, Stage IV, Second Revision, October 25.

Chemical analytical results were generated by Eurofins Lancaster Laboratories in Lancaster, PA. These data were independently validated by EcoChem, Inc. of Seattle, WA. The tabulated results in the main report are summaries, based upon the validated data. Full laboratory reports/data packages from Eurofins are attached as Appendix A. The complete laboratory results, with interpretative qualifiers (data validation qualifiers) are provided in Appendices B and C. The EcoChem validation report is attached as Appendix D.

Field notes are attached as Appendix E. Logs from soil borings advanced during this investigation are compiled in Appendix F.

This report is meant to provide a summary of data collected, with minimal interpretation. Additional interpretation will be provided at the end of the due diligence investigation.

Section 2

Soil Samples

The soil samples in this Stage were collected through a combination of direct push drilling (Geoprobe DT22 tooling) and hand augering. The nominal target depth for drilling was 15 feet, with soil samples collected at nominal depths of 0-2 feet, 2-5 feet, 5-10 feet, and 10-15 feet below the top of sample-able material. Targeted soil samples at other depths were also collected where field screening or visual observation suggested the presence of contaminants at those intervals. Because air-knifing could not be used in conjunction with collection of shallow VOC samples, all borings were hand-augered to a depth of 5 feet.

Soil samples are designated with an identification number indicating the location and depth from which it was collected. The sample names consist of the following parts:

CP – XXX(X) – Y, where

XXX(X)(xx) is a 3 or 4 digit number indicating the boring number and suffixes (xx); the suffix “R” indicates that the borehole is a “redrill” due to refusal or other issue; “R2” would be the second “redrill” location.

Y(y) is an indication of the sample depth, as recorded on the boring log and in the field book. The depth indications are in alphabetical order “A, B, C, D, E...” from the shallowest to the deepest sample. In most borings, the “A” interval was subdivided for sampling and analysis into two intervals: A(0-2) and A(2-5).

Field Duplicates were sent to the laboratory as “blind duplicates” with no indication of sample location. BD samples were designated as:

BD-nn-mm/dd/yy, where

nn is a 2-digit number identifying the numerical sequence of the blind duplicate. Values of “nn” for field crew 1 start with the number “1.” Values for field crew 2 start with the number “2”, etc.

mm/dd/yy is an 8-digit code representing the date by month, date and year.

The letter suffixes (e.g. A, B, C, D...) indicate the nominal depths below the top of material that can be sampled. The actual sample depths reported take into account the total thickness of surficial materials which could not be sampled, e.g. concrete, asphalt, coarse fill, road base. In the case of samples collected on bare soil, the nominal depth is equal to the actual depth.

The primary target analytes for Stage II were the contaminants of concern (COCs) previously identified for the site, plus metals. Both the volatile organic compound (VOC) and semi-volatile organic compound (SVOC) results were reported with the 15 most significant Tentatively Identified Compounds (TICs). All VOC samples were collected using Encore-type sample devices (Method 5035).

2.1 Results

All soil samples for which any analysis was completed are listed in Table 1, and shown in Figure 2. In addition, blind duplicates (Table 2) were collected on at least a daily basis. Table 3 illustrates the analytical methods applied to each sample. Excluding laboratory surrogates, laboratory duplicates and QA samples, the total database of results for Stage III and IV soil samples constitutes approximately 62,000 records. A summary of analytical results, with the frequency of detection is presented in Table 4. As noted above, selected samples were analyzed for trivalent and hexavalent chromium species. These results are summarized in Table 5.

The analytical results for trip blanks and rinsate blanks are summarized in Table 6.

2.2 Tentatively Identified Compounds (TICs)

The TO-15 analytical results were reported with the top 15 tentatively identified compounds (TICs). Table 7 summarizes the TICs from this analysis.

For the soil VOC analysis, 17 compounds were identified in more than 1% of the analytical results. The most frequently identified TICs are those associated with industrial process and/or petroleum products.

For the soil SVOCs, there were 14 tentatively identified compounds that occurred in more than 1% of the samples. These are identified as either common biological hydrocarbons, laboratory contaminants, or industrial chemicals.

2.3 QA/QC

The full Validation Data Report by EcoChem, Inc. is presented in Appendix D. As summarized in that report:

“ The overall quality of the data is acceptable. A total of 4,794 data points (7.77%) were estimated (J/UJ/NJ) and 207 data points (0.335%) were qualified as not detected (U). Qualified data points may have a larger associated bias or may be less precise than unqualified data, but are usable for the intended purpose.

A total of 8 data points were rejected based on very low matrix spike recoveries. Data that have been rejected should not be used for any purpose.

All other data, as qualified, are acceptable for use.”

Section 3

Comparison to Existing Standards

Table 8 illustrates the analytical results that exceed USEPA's most recent risk-based screening levels (RBSLs). RBSLs are not cleanup standards, but are used here to illustrate where contaminant concentrations might exceed health-based standards. Compounds that exceed RBSLs include volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), total petroleum hydrocarbons (TPH), and Polychlorinated biphenyls (PCBs). RBSL exceedances of one or more compounds occur at all depth intervals (A – H). Figures 4 to 8 illustrate the RBSL exceedances at different sample depth intervals.

Hexavalent Chromium exceeded RBSL at several depths in a single boring location, CP-2219.

Final cleanup standards have not been established for the BFC. To date, there have been a number of cleanup standards issued within corrective measures studies for SWMUs across the site (Table 9). Several of the analytical results reported here exceed the existing cleanup standards for the BFC, for compounds including: Trichloroethene (TCE), Vinyl Chloride, PCBs, and TPH.

* "Surface material" refers to coarse fill, road base, concrete, or asphalt at the ground surface. This material was not sampled.
 Depths of sample intervals are in feet below ground surface (ft BGS).

PCB: Polychlorinated biphenyl

TPH-GRO: Total petroleum hydrocarbon: gasoline range organics. TPH-GRO was compared to the RBSL for Total Petroleum Hydrocarbons (Aromatic Low), the lowest RBSL for hydrocarbons in this range.

TPH-DRO: Total petroleum hydrocarbon: diesel range organics. TPH-DRO was compared to the RBSL for Total Petroleum Hydrocarbons (Aliphatic Medium), the lowest RBSL for hydrocarbons in this range.

TPH-ORO: Total petroleum hydrocarbon: oil range organics. TPH-ORO was compared to the RBSL for Total Petroleum Hydrocarbons (Aromatic High), the lowest RBSL for hydrocarbons in this range.
